

ABSTRACT

Combination screen and shelf unit that is configured to enclose an area and that features one or more removable shelves. Each removable shelf is in contact with and supported horizontally by the screening structure. Fasteners are not required to keep the shelves positioned. Thus, each shelf can be held in place frictionally between two screening members, one or both of which can be an existing wall or other permanent structure. A method of enclosing an area includes providing at least one screening member, providing at least one removable shelf, and horizontally supporting each removable shelf with a screening member such that the screening member and shelf or shelves are configured to enclose the area. Items may be placed on the shelves, thereby providing storage or display capability.
